

Borealis Class Heavy Hauler

Ram-Scoop Dynamics

The initial EMP from the Pulse Initiators fires, the Magnetic Constrictors charge up and form the Flux-Well (sort of a pseudo gravity well) that causes matter to be directed towards the Ram-Scoops. This also serves to divert matter from the path of the ship and acts as a shield for the ship while under power. The faster the ship travels, the deeper this well becomes and the further from the ship as well, providing additional protection at higher speeds.

OCM
Initial formation of magnetic field

As speed increases the depth of the magnetic field increases as does its distance from the ship
