

This rocket's internal construction is very similar to other two stage kits. What I found as a big help in putting together the engine mount assembly is using two spent engine casings. Just glue two engine casings end to end. Next take a piece of card board from a cereal box ($2\frac{1}{4}'' \times 3\frac{3}{4}''$) and rap it evenly around where the engines butt together. BE SURE to draw a line on the cardboard indicating where the two engines meet.

The tooth picks should be flattened on one side, so they seat better on the body tube. BE SURE to add glue filllets on all sides of the tooth picks to reduce drag and to enhance appearance.
